TDPS Final Report Guidelines 2024-2025

Written communication is an integral part of engineering tasks. The ability to write a technical report in a clear and concise manner is a mark of a good engineer. An engineer must be able to translate the formulae and numbers into an understandable written form. Your technical report must inform readers of the reasons, means, results and conclusions of the TDPS project.

Each team should produce a detailed written technical report. The project report should be neat, readable, and self-contained. Also, it should be written with the readers in mind. Any class member should be able to understand your report, and benefit from the results you obtain. Therefore, you should include adequate references and/or background materials and you should use tables, diagrams, graphs, figures, and portions of printouts to enhance readers' comprehension of your project.

For the group report, you should use the IEEE transaction paper template that is available on Moodle. The page limit is 10 pages. You should have the team name, number and the group member names included in the author list. Do not change the given font size or margins to fit more text in your report. The group report should have the following sections:

Abstract: a summary of your achievement on the project highlighting key results.

Introduction: This section is where the necessary concepts that were applied in order to obtain the results of the TDPS project are explained. Include background material (literature survey) and discuss the scope and limitations of your project.

Overall system design approach: This section will include the overall design and technical approach that is proposed by your team to complete the given tasks. It should have the flowchart used for the project planning.

Experimental Design - Subsystem Design and Solution(s): these sections should briefly detail the different subsystem components used in the project, just enough to give an overview of what was used on the project.

Results: this should include the results of the experimental investigations. Also include comprehensive/significant analysis and discussion on the technical problem you have solved, and the results achieved.

Analysis, conclusions and future work: The overall system integration (hardware and software) results should be discussed in this section. Think of the conclusion as a short restatement of important points being presented in the report. Once conclusions are made, make some recommendations. Explain how useful the results are.

References: should include the list of references used in the report.

For the individual report, you need to write a 5 page report (excluding the cover page) to detail your contribution to the project. The report should have a cover page with the individual's name and team number. The report should also have a literature review of the technical content you are reporting on, a clear analysis and conclusion. The individual report should have the following sections:

Introduction: This section should introduce the technical part delivered by the individual. It should also include background material (literature survey) of the technical part delivered by the individual.

Experimental Design - Subsystem Design and Solution(s): this section should briefly detail the subsystem component delivered by the individual.

Results: this section should include the results of the experimental investigations of the individual members. Include comprehensive/significant analysis and discussion on the technical problem you have solved, and the results achieved.

Analysis, conclusions and future work: Analyse the results presented in the report. The conclusion is a short restatement of important points being presented in the report. Once conclusions are made, make some recommendations. Explain how useful the results are.

References: should include the list of references used in the report.

Both, the group and individual reports should be uploaded to your private channel on MS Teams by Monday 16th June.
